## Rise \& Run/ $\boldsymbol{y}=\boldsymbol{m} \boldsymbol{x}+\boldsymbol{b}$ practice

ex. \# 1 Solve for $\mathbf{y}(\mathbf{y}=\mathbf{m x}+\mathrm{b})$.

| $5 x+y=-8$ | Here we need to <br> get rid of $5 x$ to <br> get $y$ alone on <br> one side of the <br> equal sign. Since <br> it is in front, we |  | 2) State $m$ and $b$. |
| ---: | :--- | ---: | :--- |

ex. \#2 Solve for $y$.

$$
\begin{array}{ll}
5 x+2 y=-8 & \begin{array}{l}
\text { Subtract } 5 x \text { as we } \\
\text { did in the last } \\
\text { problem. }
\end{array} \\
2 y=-8-5 x & \begin{array}{l}
\text { Put the equation } \\
\text { in the form of } \\
y=m x+b
\end{array} \\
2 y=-5 x-8 & \begin{array}{l}
\text { To get } y \text { by itself, } \\
\text { get rid of the } 2 .
\end{array} \\
\frac{2 y}{2}=\frac{-5 x}{2}-\frac{8}{2} \begin{array}{l}
\text { Do the opposite } \\
\text { of multiplying by } \\
2, \text { which is divide } \\
\text { by } 2 .
\end{array} \\
y=-\frac{5}{2} x-4 & \begin{array}{l}
\text { m }=-\frac{5}{2}: b=-4
\end{array}
\end{array}
$$

1. $3 x+y=5$
1) Solve for $y$
2) State $m$ and $b$.
3) Solve for $y$
4) State $m$ and $b$.
ex. \#3 Solve for $\mathbf{y}$.

$$
\begin{array}{ll}
-2 x-3 y=15 & \begin{array}{l}
\text { Since -2x is in } \\
\text { front, subtract }-2 x \\
\text { to get }-3 y \text { alone. } \\
\text { (notice the minus } \\
\text { sign remains in } \\
\text { front of the } 3 y \text { ) }
\end{array} \\
-3 y=15--2 x & \begin{array}{l}
\text { Don't forget two } \\
\text { minus signs } \\
\text { change to a + sign. }
\end{array} \\
-3 y=15+2 x & \begin{array}{l}
\text { Put the equation } \\
\text { in the right order. } \\
\text { (y = mx + b) }
\end{array} \\
-3 y=2 x+15 & \begin{array}{l}
\text { Divide by }-3 \text { to } \\
\text { get } y \text { alone. }
\end{array} \\
-3 y \\
-3 & \frac{2 x}{-3}+\frac{15}{-3} \\
\begin{array}{l}
\text { Simplify. } \\
\text { Remember that } \\
\text { adding -5 is the }
\end{array} \\
y=-\frac{2}{3} x+-5 & \begin{array}{l}
\text { same as } \\
\text { subtracting +5. } \\
\text { m }
\end{array} \\
\mathbf{y}=-\frac{2}{3} x-5 & \begin{array}{l}
\text { m }=-\frac{2}{3}
\end{array}
\end{array}
$$

ex. \#4 Solve for $y$.

$$
\begin{array}{ll}
6 x-y=15 & \begin{array}{l}
\text { Get rid of 6x to } \\
\text { get } y \text { alone. Since } \\
\text { 6x is in front, } \\
\text { subtract it. }
\end{array} \\
-y=15-6 x & \begin{array}{l}
\text { Notice the negative sign } \\
\text { stays with the } y . \\
\text { Put the in the } \\
\text { right order. } \\
(y=m x+b)
\end{array} \\
-y=-6 x+15 & \begin{array}{l}
\text { Remember that } \\
\text {-y is the same as } \\
-1 \bullet y \text { or }-1 y, \text { so } \\
\text { divide by }-1 \text { to get } \\
\text { rid of the negative } \\
\text { sign in front of } y .
\end{array} \\
y=6 x-15 & \begin{array}{l}
\text { m=-6 } ; b=15
\end{array}
\end{array}
$$

5. $-4 x-2 y=-14$ 1) Solve for $y$
2) State $m$ and b.
6. $6 x+2 y=8$
1) Solve for $y$
2) State $m$ and $b$.
7. $\mathbf{3 x}-\mathrm{y}=\mathbf{2}$
1) Solve for $y$
2) State $m$ and $b$.
3) Solve for $y$
4) State $m$ and $b$.
